the primary objective of this book is to advance the state of the art in specifying and fitting to data structural multi sector dynamic macroeconomic models and empirically implementing them the fundamental construct upon which we build is the ramsey model a most attractive feature of this model is the insights it provides into the dynamics of an economy in transition to long run equilibrium with some exceptions ramsey models are highly aggregated typically single sector models however interest often lies in understanding the forces of economic growth across multiple sectors of an economy and on how policy impacts likely play out over time such analyses call for more disaggregated models that can be fit to country or regional data this book shows how to i extend the basic model to multiple sectors ii how to adapt the basic model to account for policy instruments and iii fit the model to data and obtain equilibrium values both forward and backward in time from the data points to which the model is initially fit

this text is an introduction to harmonic analysis on symmetric spaces focusing on advanced topics such as higher rank spaces positive definite matrix space and generalizations it is intended for beginning graduate students in mathematics or researchers in physics or engineering as with the introductory book entitled harmonic analysis on symmetric spaces euclidean space the sphere and the poincaré upper half plane the style is informal with an emphasis on motivation concrete examples history and applications the symmetric spaces considered here are quotients $x/g/k$ where g is a non compact real lie group such as the general linear group $gl(n, \mathbb{R})$ of all $n \times n$ non singular real matrices and k is the maximal compact subgroup of orthogonal matrices other examples are siegel's upper half plane and the quaternionic upper half plane in the case of the general linear group one can identify x with the space p_n of $n \times n$ positive definite symmetric matrices many corrections and updates have been incorporated in this new edition updates include discussions of random matrix theory and quantum chaos as well as recent research on modular forms and their corresponding L functions in higher rank many applications have been added such as the solution of the heat equation on p_n the central limit theorem of donald st p richards for p_n results on densest lattice packing of spheres in euclidean space and $gl(n, \mathbb{R})$ analogs of the weyl law for eigenvalues of the laplacian in plane domains topics featured throughout the text include inversion formulas for

fourier transforms central limit theorems fundamental domains in x for discrete groups Γ such as the modular group $gl\ n\ z$ of $n \times n$ matrices with integer entries and determinant 1 connections with the problem of finding densest lattice packings of spheres in euclidean space automorphic forms hecke operators L functions and the selberg trace formula and its applications in spectral theory as well as number theory
