discrete event simulation consists of a collection of techniques that when applied to a discrete event dynamical system generates sequences called sample paths that characterize its behavior the collection includes modelling concepts for abstracting the essential features of a system using specially designed software for converting these relationships into computer executable code capable of generating the requisite sample path data outlining procedures for converting these data into estimates of systems performances and then illustrating methods for assessing how well these estimates approximate true but unknown system behavior this book is intended for upper level undergraduate and graduate students in operations research and management science mathematics industrial engineering computer science and business and features extensive exercises throughout this concept of modelling complex sytems allows a relatively low cost way of gathering information for decision making principally offered are four problems for student exercises each is progressively brought forward through the modelling programming and analysis chapters providing continuity to the learning process

this book is the first comprehensive attempt to solve what hartry field has called the central problem in the metaphysics of causation the problem of reconciling the need for causal notions in the special sciences with the limited role of causation in physics if the world evolves fundamentally according to laws of physics what place can be found for the causal regularities and principles identified by the special sciences douglas kutach answers this question by invoking a novel distinction between fundamental and derivative reality and a complementary conception of reduction he then constructs a framework that allows all causal regularities from the sciences to be rendered in terms of fundamental relations by drawing on a methodology that focuses on explaining the results of specially crafted experiments kutach avoids the endless task of catering to pre theoretical judgments about causal scenarios this volume is a detailed case study that uses fundamental physics to elucidate causation but technicalities are eschewed so that a wide range of philosophers can profit the book is packed with innovations new models of events probability counterfactual dependence influence and determinism these lead to surprising implications for topics like newcomb s paradox action at a distance simpson s paradox and more kutach explores the special connection between causation and time ultimately providing a never before presented explanation for the direction of causation along the way readers will discover that events cause themselves that low barometer readings do cause thunderstorms after all and that we humans routinely affect the past more than we affect the future

the work presented in this phd dissertation is the first search at cms for higgs bosons produced in association with top quarks tth in a final state consisting of only jets the results presented in this book uncover a new class of tth events that will help us elucidate our understanding of the yukawa sector interactions between the higgs boson and the top quark despite this being the most common decay signature for tth a large contamination of sm backgrounds makes it the most challenging for extracting a signal from data the phd thesis presents many sophisticated tools and techniques that were developed in order to overcome these challenges these tools pave the way for future analyses to investigate other standard model and beyond standard model physics
