the main goal of this book is to prove analytically and validate experimentally that synchronization in multi composed mechanical systems can be achieved in the case of partial knowledge of the state vector of the systems i e when only positions are measured for this purpose synchronization schemes based on interconnections between the systems feedback controllers and observers are proposed because mechanical systems include a large variety of systems and since it is impossible to address all of them the book focuses on robot manipulators nonetheless the ideas developed here can be extended to other

mechanical systems such as mobile robots motors and generators

despite the fact that sophus lie s theory was virtually the only systematic method for solving nonlinear ordinary differential equations odes it was rarely used for practical problems because of the massive amount of calculations involved but with the advent of computer algebra programs it became possible to apply lie theory to concrete problems

this classic reference details methods for effectively analyzing non standard or messy data sets the authors introduce each topic with examples follow up with a theoretical discussion and conclude with a case study they emphasize the distinction between design structure and the structure of treatments and focus on using the techniques with several statistical packages including sas bmdp and spss
