surveying the two centuries that preceded jim crow s demise race and education in new orleans traces the course of the city s education system from the colonial period to the start of school desegregation in 1960 this timely historical analysis reveals that public schools in new orleans both suffered from and maintained the racial stratification that characterized urban areas for much of the twentieth century walter c stern begins his account with the mid eighteenth century kidnapping and enslavement of marie justine sirnir who eventually secured her freedom and played a major role in the development of free

black education in the crescent city as sirnir s story and legacy illustrate schools such as the one she envisioned were central to the black antebellum understanding of race citizenship and urban development black communities fought tirelessly to gain better access to education which gave rise to new strategies by white civilians and officials who worked to maintain and strengthen the racial status quo even as they conceded to demands from the black community for expanded educational opportunities the friction between black and white new orleanians continued throughout the nineteenth century and well into the twentieth when conflicts over land and resources sharply intensified stern argues that the post reconstruction reorganization of the city into distinct black and white enclaves marked a new phase in the evolution of racial disparity segregated schools gave rise to segregated communities which in turn created structural inequality in housing that impeded desegregation s capacity to promote racial justice by taking a long view of the interplay between education race and urban change stern underscores the fluidity of race as a social construct and the extent to which the jim crow system evolved through a dynamic though often improvisational process a vital and accessible history race and education in new orleans provides a comprehensive look at the ways the new orleans school system shaped the city s racial and urban landscapes

advances in digital signal processing algorithms and computer technology have combined to produce real time systems with capabilities far beyond those of just few years ago nonlinear adaptive methods for signal processing have emerged to provide better array gain performance however they lack the robustness of conventional algorithms the challenge remains to develop a concept that exploits the advantages of both a scheme that integrates these methods in practical real time

systems the advanced signal processing handbook helps you meet that challenge beyond offering an outstanding introduction to the principles and applications of advanced signal processing it develops a generic processing structure that takes advantage of the similarities that exist among radar sonar and medical imaging systems and integrates conventional and nonlinear processing schemes

image compression the navier stokes equations and detection of gravitational waves are three seemingly unrelated scientific problems that remarkably can be studied from one perspective the notion that unifies the three problems is that of oscillating patterns which are present in many natural images help to explain nonlinear equations and are pivotal in studying chirps and frequency modulated signals the first chapter of this book considers image processing moreprecisely algorithms of image compression and denoising this research is motivated in particular by the new standard for compression of still images known as jpeg 2000 the second chapter has new results on the navier stokes and other nonlinear evolution equations frequency modulated signals and theiruse in the detection of gravitational waves are covered in the final chapter in the book the author describes both what the oscillating patterns are and the mathematics necessary for their analysis it turns out that

this mathematics involves new properties of various besov type function spaces and leads to many deep results including new generalizations of famous gagliardo nirenberg and poincare inequalities this book is based on the dean jacqueline b lewis memorial lectures given bythe author at rutgers university it can be used either as a textbook in studying applications of wavelets to image processing or as a supplementary resource for studying nonlinear evolution equations or frequency modulated signals most of the material in the book did not appear previously inmonograph literature
