the study of euclidean distance matrices edms fundamentally asks what can be known geometrically given only distance information between points in euclidean space each point may represent simply location or abstractly any entity expressible as a vector in finite dimensional euclidean space the answer to the question posed is that very much can be known about the points the mathematics of this combined study of geometry and optimization is rich and deep throughout we cite beacons of historical accomplishment the application of edms has already proven invaluable in discerning biological molecular conformation the emerging practice of localization in wireless sensor networks the global positioning system gps and distance based pattern recognition will certainly simplify and benefit from this theory we study the pervasive convex euclidean bodies and their various representations in particular we make convex polyhedra cones and dual cones more visceral through illustration and we study the geometric relation of polyhedral cones to nonorthogonal bases biorthogonal expansion we explain conversion between halfspace and vertex descriptions of convex cones we provide formulae for determining dual cones and we show how classic alternative systems of linear inequalities or linear matrix inequalities and optimality conditions can be explained by generalized inequalities in terms of convex cones and their duals the conic analogue to linear independence called conic independence is introduced as a new tool in the study of classical cone theory the logical next step in the progression linear affine conic any convex optimization problem has geometric interpretation this is a powerful attraction the ability to visualize geometry of an optimization problem we provide tools to make visualization easier the concept of faces extreme points and extreme directions of convex euclidean bodies is explained here crucial to understanding convex optimization the convex cone of positive semidefinite matrices in particular is studied in depth we mathematically interpret for example its inverse image under affine transformation and we explain how higher rank subsets of its boundary united with its interior are convex the chapter on geometry of convex functions observes analogies between convex sets and functions the set of all vector valued convex functions is a closed convex cone included among the examples in this chapter we show how the real affine function relates to convex functions as the hyperplane relates
