research paper postgraduate from the year 2015 in the subject engineering

automotive engineering course engineering and technology language english abstract in recent times research on effective acoustic emission ae based methods for condition monitoring and fault recognition has attracted many researchers they recognize that the advanced methods of supervision fault recognition become increasingly important for many technical processes for the improvement of reliability safety and efficiency the use of acoustic signals for fault diagnosis in four strokes internal combustion engine has grown significantly due to advances in the progress of digital signal processing algorithms and implementation techniques the classical approaches are limited to checking of some measurable output variables and does not provide a deeper insight and usually do not allow a fault diagnosis engine problems are caused primarily by improper maintenance or fatigue caused by normal wear and tear and also worn out or clogged vehicle parts the main cause of overheating of the engine engine surging and other problems is noticed as worn out parts the faults in internal combustion ic engine reduces the performance fuel average smoothness also a change in engine sound is observed the faults in ic engines can be recognized and repaired based on engine sound and past experience but as the engines are becoming more and more complex getting expertise in fault recognition and localization is difficult so there is a need of assistance system for fault recognition in ic engine which will tell you about the possible fault based on the data provided to it

in this paper a bank of kalman filters is applied to aircraft gas turbine engine sensor and actuator fault detection and isolation fdi in conjunction with the detection of component faults this approach uses multiple kalman filters each of which is designed for detecting a specific sensor or actuator fault in the event that a fault does occur all filters except the one using the correct hypothesis will produce large estimation errors thereby isolating the specific fault in the meantime a set of parameters that indicate engine component performance is estimated for the detection of abrupt degradation the proposed fdi approach is applied to a nonlinear engine simulation at nominal and aged conditions and the evaluation results for various engine faults at cruise operating conditions are given the ability of the proposed approach to reliably detect and isolate sensor and actuator faults is demonstrated 7 tables 4 figures 17 refs

this book constitutes the proceedings of the first international conference on 5g for future wireless networks 5gwn 2017 held in beijing china in april 2017 the 64 full papers were selected from 135 submissions and present the state of the art and

practical applications of 5g technologies the exponentially growing data traffic caused by the development of mobile internet and smart phones requires powerful networks the fifth generation 5g techniques are promising to meet the requirements of this explosive data traffic in future mobile communications

diesel engines also known as ci engines possess a wide field of applications as energy converters because of their higher efficiency however diesel engines are a major source of nox and particulate matter pm emissions because of its importance five chapters in this book have been devoted to the formulation and control of these pollutants the world is currently experiencing an oil crisis gaseous fuels like natural gas pure hydrogen gas biomass based and coke based syngas can be considered as alternative fuels for diesel engines their combustion and exhaust emissions characteristics are described in this book reliable early detection of malfunction and failure of any parts in diesel engines can save the engine from failing completely and save high repair cost tools are discussed in this book to detect common failure modes of diesel engine that can detect early signs of failure
