the basic idea of the particular way of understanding mental phenomena that has inspired the cognitive revolution is that as a result of certain relatively recent intellectual and technological innovations informed theorists now possess a more powerfully insightful comparison or model for mind than was available to any thinkers in the past the model in question is that of software or the list of rules for input output and internal transformations by which we determine and control the workings of a computing machine s hardware although this comparison and its many implications have dominated work in the philosophy psychology and neurobiology of mind since the end of the second world war it now shows increasing signs of losing its once virtually unquestioned preeminence thus we now face the question of whether it is possible to repair and save this model by means of relatively inessential tinkering or whether we must reconceive it fundamentally and replace it with something different in this book twenty eight leading scholars from diverse fields of cognitive science linguistics psychology neurophysiology and philosophy
