a powerful new monograph from an aerodynamicist reviewing modern conventional aerodynamic approaches this volume covers aspects of subsonic transonic and supersonic flow inverse problems shear flow analysis jet engine power addition engine and airframe integration and other areas providing readers with the tools needed to evaluate their own ideas and to implement the newer methods suggested in this book this new book by a prolific fluid dynamicist and mathematician who has published more than twenty research monographs represents not just another contribution to aerodynamics but a book that raises serious questions about traditionally accepted approaches and formulations providing new methods that solve longstanding problems of importance to the industry while both conventional and newer ideas are discussed the presentations are readable and geared to advanced undergraduates with exposure to elementary differential equations and introductory aerodynamics principles readers are introduced to fundamental algorithms with fortran source code for basic applications such as subsonic lifting airfoils transonic supercritical flows utilizing mixed differencing models for inviscid shear flow aerodynamics and so on these are models they can extend to include newer effects developed in the second half of the book many of the newer methods have appeared over the years in various journals and are now presented with deeper

perspective and integration this book helps readers approach the literature more critically rather than simply understanding an approach for instance the powerful type differencing behind transonic analysis or the rationale behind conservative formulations or the use of euler equation methods for shear flow analysis when they are unnecessary the author guides and motivates the user to ask why and why not and what if and often more powerful methods can be developed using no more than simple mathematical manipulations for example cauchy riemann conditions which are powerful tools in subsonic airfoil theory can be readily extended to handle compressible flows with shocks rotational flows and even three dimensional wing flowfields in a variety of applications to produce powerful formulations that address very difficult problems this breakthrough volume is certainly a must have on every engineer s bookshelf

if following the solvent extraction of a hydrocarbon from a plant it is not known whether it is one or the other a method of distinguishing the two is described by hendricks wildman and jones 1946 the technique involves the infra red absorption spectra of the two isomers at about 12 mp the relative absorption coefficient of rubber is 42 greater than for gutta schlesinger and leper 1951 describe two procedures for separation of the rubber and gutta hydrocarbons from large quantities of crude chicle in one the chicle is extracted with benzene which dissolves both isomers an excess absolute ethyl acetate is added and the mixture stored at 5 c overnight the gutta precipitates out and the rubber remains in solution the other method is as follows 1 ten grams of chicle are extracted with acetone for 24 hours in a soxhlet extraction apparatus 2 the insoluble material in the thimble is allowed to it dry then immersed in 150 ml of cold skellysolve b in a refrigerator at 10 c and allowed to stand for 48 hours with occasional agitation 3 the thimble is then removed from the solvent and the enclosed residue washed several times with fresh cold skellysolve b 4 an excess of acetone and a few drops of a concentrated aqueous solution of sodium iodide are added to the combined skellysolve b extract and washings and allowed to stand overnight in a refrigerator
