the field of movement disorders is relatively broad encompassing disorders of increased movement such as tremors dystonia and tics to disorders characterized by a paucity of movement such as Parkinson's disease our understanding of the pathogenic mechanisms and our treatment options are expanding at a rapid pace this expansion ranges from the medical and surgical advances in treating Parkinson's disease to the flood of genetic abnormalities that have now been found to cause various movement disorders although many patients are seen by the movement disorders specialist in neurology clinics around the country most of these patients receive their followup care from a primary care physician or general neurologist who must be versed in the characteristics and treatment plans of this diverse group of disorders the major goal of Parkinson's disease and movement disorders diagnosis and treatment guidelines for the practicing physician is to distill this immense amount of information and to educate the practitioner about the many facets of the movement disorders field we believe
