published by the american geophysical union as part of the coastal and estuarine studies volume 47 there can be little doubt that estuarine coastal and shelf circulation modeling will assume increasing importance in the immediate future as we work through the implications of industrialization for oceanic systems these issues will place new and serious operational demands on available models and the rapid increase in computational power we now enjoy makes it possible to respond with detailed simulations in many categories as a result we are witnessing an explosive growth in the quantity of model generated information lacking however is a concomitant increase in its quality or even in quality control procedures a single simulation exercise is easily capable of generating gigabytes of output in a matter of hours most of the data will necessarily go unexamined by its progenitors yet it is highly likely that disks full of simulation output will be used extensively as learning tools for students and researchers as criteria for engineering design as a basis for operational decision making and in the formulation of public policy the purpose of this volume is to assemble and present what is known about the intrinsic quality of simulation output its correctness for various purposes we have operated on the twin premises that 1 every simulation has some intrinsic value and 2 every simulation has serious drawbacks between these two extremes lies a vast gulf of uncertainty and potential error which must be bridged in a professional way if modeling is to achieve its potential in the coastal ocean this is the basic challenge put to the authors of this volume essentially we seek to describe and consolidate approaches theories and practices for extracting information from models and to understand the limits of their proper use
