this book is based upon lecture notes developed by jack kiefer for a course in statistical inference he taught at cornell university the notes were distributed to the class in lieu of a textbook and the problems were used for homework assignments relying only on modest prerequisites of probability theory and calculus kiefer's approach to a first course in statistics is to present the central ideas of the modern mathematical theory with a minimum of fuss and formality he is able to do this by using a rich mixture of examples pictures and mathematical derivations to complement a clear and logical discussion of the important ideas in plain english the straightforwardness of kiefer's presentation is remarkable in view of the sophistication and depth of his examination of the major theme how should an intelligent person formulate a statistical problem and choose a statistical procedure to apply to it kiefer's view in the same spirit as neyman and wald is that one should try to assess the consequences of a statistical choice in some quantitative frequentist formulation and ought to choose a course of action that is verifiably optimal or nearly so without regard to the perceived attractiveness of certain dogmas and methods

causal inference in statistics a primer causality is central to the understanding and use of data without an understanding of cause effect relationships we cannot use data to answer questions as basic as does this treatment harm or help patients but though hundreds of introductory texts are available on statistical methods of data analysis until now no beginner level book has been written about the exploding arsenal of methods that can tease causal information from data causal inference in statistics fills that gap using simple examples and plain language the book lays out how to define causal parameters the assumptions necessary to estimate causal parameters in a variety of situations how to express those assumptions mathematically whether those assumptions have testable implications how to predict the effects of interventions and how to reason counterfactually these are the foundational tools that any student of statistics needs to acquire in order to use statistical methods to answer causal questions of interest this book is accessible to anyone with an interest in interpreting data from undergraduates professors researchers
