the explosion of interest effort and information about the ocean since about 1950 has produced many thousand scientific articles and many hundred books in fact the outpouring has been so large that authors have been unable to read much of what has been published so they have tended to concentrate their own work within smaller and smaller subfields of oceanography summaries of information published in books have taken two main paths one is the grouping of separately authored chapters into symposia type books with their inevitable overlaps and gaps between chapters the other is production of lightly researched books containing drawings and tables from previous publications with due credit given but showing assembly line writing with little penetration of the unknown only a few books have combined new and previous data and thoughts into new maps and syntheses that relate the contributions of observed biological chemical geological and physical processes to solve broad problems associated with the shape composition and history of the oceans such a broad synthesis is the objective of this book in which we tried to bring together many of the pieces of research that were deemed to be of manageable size by their originators the composite may form a sort of plateau above which later studies can rise possibly benefited by our assembly of data in the form of new maps and figures

cancer metabolism is a critical area of research central to understanding how malignant tumors manipulate metabolic pathways to support their growth and survival these alterations not only fuel rapid tumor expansion but also reshape the tumor microenvironment this environment in turn impacts immune cell function often creating an immunosuppressive habitat that allows cancer cells to evade the immune response additionally the role of metabolic reprogramming in promoting cancer metastasis the spread of cancer cells to new areas complicates therapeutic approaches making it a critical avenue for investigation this research topic aims to elucidate the complex interactions between cancer cell metabolism and immunotherapy effectiveness by diving into the metabolic adaptations of cancer cells this study seeks to uncover how these changes impair immune cell function and contribute to the cancer s ability to metastasize understanding these mechanisms could pave the way for novel therapeutic strategies that enhance immunotherapy responses and curb metastatic progression ultimately aiming to improve survival rates in cancer patients to advance our understanding in this field the scope of this research topic will focus on the metabolic underpinnings that facilitate cancer s evasion of immune surveillance and its ability to metastasize we invite submissions that explore but are not limited to the following themes the influence of cancer metabolism on the behavior and efficacy of immune cells metabolic checkpoints that could serve as new targets for immunotherapy metabolic reprogramming of immune cells like t cells and macrophages within the tumor microenvironment innovative combination therapies that integrate metabolic and immune modulating approaches identification of biomarkers

that connect metabolic and immune pathways to metastatic behavior aiding in the development of personalized cancer treatments
