the purpose of this book is to provide a smooth transition from linear elasticity through the nonlinear behaviour induced by unilateral constraints to full scale plasticity it presents applications of mathematical programming to nonlinear static analysis of skeletal structures trusses frames grillages etc it is demonstrated that under the assumption of small displacements a broad class of structural

analysis problems exhibit the same internal structure such is the case with elastic analysis in the presence of unilateral supports or tension only members elastic plastic analysis in both holonomic and non holonomic formulations and finally ultimate load analysis throughout the book a clear and uniform methodology of presentation is used first a complete set of governing relations is derived for a particular problem then that set is shown to be equivalent to a certain minimax problem the saddle point problem that in turn can be replaced by a pair of constrained extremum problems dual mp problems thus the complementary energy principles are established furnishing the basis for the development of methods of numerical solution
