proportional optimization and fairness is a long needed attempt to reconcile optimization with apportionment in just in time jit sequences and find the common ground in solving problems ranging from sequencing mixed model just in time assembly lines through just in time batch production balancing workloads in event graphs to bandwidth allocation internet gateways and resource allocation in computer operating systems the book argues that apportionment theory and optimization based on deviation functions provide natural benchmarks for a process and then looks at the recent research and developments in the field individual chapters look at the theory of apportionment and just in time sequences minimization of just in time sequence deviation optimality of cyclic sequences and the oneness bottleneck minimization competition free instances fraenkel s conjecture and optimal admission sequences response time variability applications to the liu layland problem and pinwheel scheduling temporal capacity constraints and supply chain balancing fair queuing and stride scheduling and smoothing and batching

over recent years important contributions on the topic of solving various aquifer problems have been presented in numerous papers and reports the scattered and wide ranging nature of this information has made finding solutions and best practices difficult comprehensive and self contained applied flow and solute transport modeling in aquifers co

scientific computing is a fast growing and fast changing area whose applications to various branches of science engineering medicine economics and others are increasing in number and relevance every day there are two main reasons among others that make scientific computing change so rapidly one is the increasing number of different research areas beginning to make use of numerical simulation from nanotechnology to genomics from computer aided diagnosis and operations in medical applications which involve often com plete simulations of parts of the human body to economics and finance each new application and each new aspect of earlier applications draws heavily on the know how that has been acquired on other problems with similar mathematical features it has to be pointed out that the lofty perspective of mathematics succeeds quite often in finding connections among very different phenomena that tum out in the end to share the same mathematical and numerical structure in tum new applica tions contribute to the cross fertilization by sending back new interpretations and suggestions which are often useful in more classical applications all this creates a resonance effect that contributes greatly to the growth rate of the whole field

mathematical programming has know a spectacular diversification in the last few decades this process has happened both at the level of mathematical research and at the level of the applications generated by the solution methods that were created to write a monograph dedicated to a certain domain of mathematical programming is under such circumstances especially difficult in the present monograph we opt for the domain of fractional programming interest of this subject was generated by the fact that various optimization problems from engineering and economics consider the minimization of a ratio between physical and or economical functions for example cost time cost volume cost profit or other quantities that measure the efficiency of a system for example the productivity of industrial systems defined as the ratio between the realized services in a system within a given period of time and the utilized resources is used as one of the best indicators of the quality of their operation such problems where the objective function appears as a ratio of functions constitute fractional programming problem due to its importance in modeling various decision processes in management science operational research and economics and also due to its frequent appearance in other problems that are not necessarily economical such as information theory numerical analysis stochastic programming decomposition algorithms for large linear systems etc the fractional programming method has received particular attention in the last three decades
