a preface should justify the existence of the book it precedes and this is invariably done in  
scientific texts by reference to the explosive growth of the field since the last such volume  
appeared in molecular biology most fields can be justifiably described as growing explosively  
as should be the case for a young and vigorous science but the study of membrane proteins  
stands out as one which has taken giant strides in the last few years ignorance of the  
structure and function of membrane proteins at the molecular level was certainly not due to  
lack of interest but rather was a result of lack of appropriate techniques it has above all  
been the development of new experimental methods which has wrenched membrane  
biochemistry out of what anthony martonosi fetchingly called its romantic phase le lots of  
ideas and few facts into an era when the determination of membrane protein structure and  
mechanism is a reasonable goal membrane proteins are generally classified as peripheral or  
integral peripheral proteins are relatively easily dissociated from membranes by mild  
treatments whence their study is essentially no different to that of soluble proteins this book  
therefore concentrates on integral proteins which are strongly bound to the membrane by  
hydrophobic interactions with lipids a crucial step in their study is of necessity the d  
velopment of methods of solubilization and purification under non denaturing conditions

this volume provides an overview of modern acoustical techniques for the measurement of  
mechanical properties chapters include fundamentals of elastic constants point source point  
receiver methods laser controlled surface acoustic waves quantitative acoustical microscopy

of solids resonant ultrasound spectroscopy elastic properties and thermodynamics sound speed as a thermodynamic property of fluids noninvasive determination of sound speed in liquids introduction to the elastic constants of gases and acoustic measurement in gases

this preface is very short not least because an introductory chapter incorporating much of the material of a conventional preface has been included and covers most of the important points in somewhat greater detail than we have scope for here the reader should consult this as a guide to the structure of this volume and the purpose it serves nevertheless some general comments are pertinent at a practical level some understanding of the properties of food biopolymers is presumably historical perhaps dating back to the invention of fire when stone age man first discovered that heating animal carcasses increased their palatability indeed one is reminded of the essay of charles lamb in which he claims that roast pork was first discovered by accident when the pig sty of an ancient chinese village was accidentally burnt to the ground consuming its unfortunate occupants in the last 20 years however substantial scientific advances have been made in this area by the application of ideas perhaps more common in other areas of macromolecular science to food biopolymer constituents and this knowledge is now being applied in a non empirical manner to the development of new products one very successful example of this approach is the work on low fat healthy option products in which understanding of the thermodynamics interactions structure and rheology of mixed protein polysaccharide gelling systems is being employed the present volume describes the application of modern macro molecular techniques to the characterisation of food biopolymers
