Section 1 to the Biosphere 1 Define the biosphere The biosphere encompasses all living organisms and their environments on Earth including the atmosphere lithosphere land and hydrosphere water 2 Explain the significance of the biosphere The biosphere is crucial for the sustenance of life on Earth It provides the oxygen we breathe the food we eat and the natural resources we rely upon The biosphere also plays a vital role in regulating Earth's climate and maintaining its delicate balance 3 What are the major components of the biosphere The major components of the biosphere include Atmosphere The gaseous layer surrounding Earth Lithosphere The solid rocky outer layer of Earth Hydrosphere All of Earth's water including oceans lakes rivers and ice Section 2 Distribution of Life 1 Describe the factors that influence the distribution of life on Earth 2 Several factors influence the distribution of life including Climate Temperature rainfall and seasonal variations significantly impact the types of organisms that can survive in a given region Geography Features like mountains oceans and continents create barriers and distinct habitats shaping species distribution Biotic factors Interactions between organisms such as competition for resources predation and disease influence their distribution Human activities Activities like deforestation pollution and habitat destruction alter the distribution of life 2 Explain how biogeography relates to the study of the biosphere Biogeography studies the distribution of species and ecosystems across Earth It provides insights into how organisms have evolved and adapted to different environments explaining patterns of biodiversity and helping us understand the impact of human activities on the biosphere Section 3 Biomes 1 What are biomes and what are some examples of terrestrial biomes Biomes are major life zones characterized by distinct climates and plant and animal communities Examples of terrestrial biomes include Tropical Rainforests High rainfall warm temperatures and diverse flora and fauna Temperate Deciduous Forests Moderate temperatures seasonal rainfall and deciduous trees Grasslands Dominated by grasses with varying rainfall and temperature Deserts Low rainfall extreme temperatures and specialized adapted plants and animals Tundra Cold treeless regions with permafrost 2 Explain how aquatic biomes differ from terrestrial biomes Aquatic biomes are defined by their water salinity and depth while terrestrial biomes are defined by their climate and vegetation Aquatic biomes include freshwater lakes rivers and saltwater oceans coral reefs environments each with unique conditions and organisms Section 4 Ecosystems 1 Define an ecosystem and explain its components An ecosystem is a community of interacting organisms and their physical environment It includes biotic living components like producers consumers and decomposers

and abiotic nonliving components like sunlight water and soil

3 2 Describe the flow of energy through an ecosystem Energy flows through an ecosystem in a unidirectional manner starting with producers plants capturing sunlight and converting it into chemical energy This energy is then passed on to consumers who eat the producers and to higherlevel consumers who eat other consumers Decomposers break down dead organic matter releasing nutrients back into the ecosystem
