some 25 years after the birth of inflationary cosmology this volume sets out to provide both an authoritative and pedagogical introduction and review of the

current state of the field readers learn about the arguments supporting the many different scenarios of cosmic inflation articles are written by eminent scientists many of whom have made pioneering contributions to the field of inflationary cosmology

this comprehensive textbook is devoted to classical and quantum cosmology with particular emphasis on modern approaches to quantum gravity and string theory and on their observational imprint it covers major challenges in theoretical physics such as the big bang and the cosmological constant problem an extensive review of standard cosmology the cosmic microwave background inflation and dark energy sets the scene for the phenomenological application of all the main quantum gravity and string theory models of cosmology born of the author's teaching experience and commitment to bridging the gap between cosmologists and theoreticians working beyond the established laws of particle physics and general relativity this is a unique text where quantum gravity approaches and string theory are treated on an equal footing as well as introducing cosmology to undergraduate and graduate students with its pedagogical presentation and the help of 45 solved exercises this book which includes an ambitious bibliography of about 3500 items will serve as a valuable reference for lecturers and researchers

protostars and planets v builds on the latest results from recent advances in ground and space based astronomy and in numerical computing techniques to offer the most detailed and up to date picture of star and planet formation including the formation and early evolution of our own solar system

quantum gravity has developed into a fast growing subject in physics and it is expected that probing the high energy and high curvature regimes of gravitating systems will shed some light on how to eventually achieve an ultraviolet complete quantum theory of gravity such a theory would provide the much needed information about fundamental problems of classical gravity such as the initial big bang singularity the cosmological constant problem planck scale physics and the early time inflationary evolution of our universe while in the first part of this book concepts of quantum gravity are introduced and approached from different angles the second part discusses these theories in connection with cosmological models and observations thereby exploring which types of signatures of modern and mathematically rigorous frameworks can be detected by experiments the third and final part briefly reviews the observational status of dark matter and dark energy and introduces alternative cosmological models edited and authored by leading researchers in the field and cast into the form of a multi author textbook at postgraduate level this volume will be of benefit to all postgraduate students and newcomers from neighboring disciplines wishing to find a comprehensive guide for their future research

written by leading scientists in the field and intended for a broader readership this is an ideal starting point for an overview of current research and developments as such the book covers a broad spectrum of laboratory astrophysics and chemistry describing recent advances in experiments as well as

theoretical work including fundamental physics and modeling chemical networks for researchers as well as students and newcomers to the field

this is a uniquely comprehensive and detailed treatment of the theoretical and observational foundations of modern cosmology by a nobel laureate in physics it gives up to date and self contained accounts of the theories and observations that have made the past few decades a golden age of cosmology

the lectures that four authors present in this volume investigate core topics related to the accelerated expansion of the universe accelerated expansion occurred in the 36 very early universe an exponential expansion in the inflationary period  $10^{-35}$  s after the big bang this well established theoretical concept had first been proposed in 1980 by alan Guth to account for the homogeneity and isotropy of the observable universe and simultaneously by alexei starobinski and has since then been developed by many authors in great theoretical detail an accelerated expansion of the late universe at redshifts  $z$

this book contains the proceedings of the 14th international conference on supersymmetry and the unification of fundamental interactions susy06 held in irvine california in june 2006 this conference took place just before the start of the large hadron collider widely anticipated to yield profound new results and provided a focus for the growing excitement in high energy physics through over 250 plenary and parallel talks

neutron stars are the most compact astronomical objects in the universe which are accessible by direct observation studying neutron stars means studying physics in regimes unattainable in any terrestrial laboratory understanding their observed complex phenomena requires a wide range of scientific disciplines including the nuclear and condensed matter physics of very dense matter in neutron star interiors plasma physics and quantum electrodynamics of magnetospheres and the relativistic magneto hydrodynamics of electron positron pulsar winds interacting with some ambient medium not to mention the test bed neutron stars provide for general relativity theories and their importance as potential sources of gravitational waves it is this variety of disciplines which among others makes neutron star research so fascinating not only for those who have been working in the field for many years but also for students and young scientists the aim of this book is to serve as a reference work which not only reviews the progress made since the early days of pulsar astronomy but especially focuses on questions such as what have we learned about the subject and how did we learn it what are the most important open questions in this area and what new tools telescopes observations and calculations are needed to answer these questions all authors who have contributed to this book have devoted a significant part of their scientific careers to exploring the nature of neutron stars and understanding pulsars everyone has paid special attention to writing educational comprehensive review articles with the needs of beginners students and young scientists as potential readers in mind this book will be a valuable source of information for these groups

volume 19 continues the reviews in modern astronomy with invited reviews and highlight contributions which were presented during the international scientific conference of the astronomical society on the topic the many facets of the universe revelations by new instruments held at the university of cologne germany september 26 october 1 2005 the contributions to the meeting published in this volume discuss among other subjects astrochemistry astrobiology cosmology star and planet formation and present overviews on new instruments in the infrared and sub millimeter wavelength range highlight karl schwarzschild lecture by g a tammann basel the ups and downs of the hubble constant

this 20th volume in the series contains 16 invited reviews and highlight contributions presented during the 2007 international scientific conference of the german astronomical society on the topic of cosmic matter held in würzburg germany the papers published here discuss a wide range of hot topics including cosmology high energy astrophysics astroparticle physics gravitational waves extragalactic and stellar astronomy together representing the roadmap for astroparticle physics in europe
