it is well known that most problems in science and engineering eventually progress into matrix problems this book gives an elementary introduction to applied matrix theory and it also includes some new results obtained in recent years the book consists of eight chapters it includes perturbation and error analysis the conjugate gradient method for solving linear systems preconditioning techniques and least squares algorithms based on orthogonal transformations etc the last two chapters include some latest development in the area in chap 7 we construct optimal preconditioners for functions of matrices more precisely let f be a function of

matrices given a matrix A there are two choices of constructing optimal preconditioners for A properties of these preconditioners are studied for different functions in chap 8 we study the bottcher wenzel conjecture and discuss related problems this is a textbook for senior undergraduate or junior graduate students majoring in science and engineering the material is accessible to students who in various disciplines have basic linear algebra calculus numerical analysis and computing knowledge the book is also useful to researchers in computational science who are interested in applied matrix theory

elementary differential equations and boundary value problems 11e like its predecessors is written from the viewpoint of the applied mathematician whose interest in differential equations may sometimes be quite theoretical sometimes intensely practical and often somewhere in between the authors have sought to combine a sound and accurate but not abstract exposition of the elementary theory of differential equations with considerable material on methods of solution analysis and approximation that have proved useful in a wide variety of applications while the general structure of the book remains unchanged some notable changes have been made to improve the clarity and readability of basic material about differential equations and their applications in addition to expanded explanations the 11th edition includes new problems updated figures and examples to help motivate students the program is primarily intended for undergraduate students of mathematics science or engineering who typically take a course on differential equations during their first or second year of study the main prerequisite for engaging with the program is a working knowledge of calculus gained from a normal two or three semester course sequence or its equivalent some familiarity with matrices will also be helpful in the chapters on systems of differential equations
