this is the first book that attempts to provide a framework in which to embed an automatic
programming system based on evolutionary learning genetic programming into a traditional software
engineering environment as such it looks at how traditional software engineering knowledge can be

integrated with an evolutionary programming process in a symbiotic way

programming languages

in the last decade there have been rapid developments in the field of computer based learning environments a whole new generation of computer based learning environments has appeared requiring new approaches to design and development one main feature of current systems is that they distinguish different knowledge bases that are assumed to be necessary to support learning processes current computer based learning environments often require explicit representations of large bodies of knowledge including knowledge of instruction this book focuses on instructional models as explicit potentially implementable representations of knowledge concerning one or more aspects of instruction the book has three parts relating to different aspects of the knowledge that should be made explicit in instructional models knowledge of instructional planning knowledge of instructional strategies and knowledge of instructional control the book is based on a nato advanced research workshop held at the university of twente the netherlands in july 1991

this book constitutes the refereed proceedings of the 17th international conference on artificial intelligence in education aied 2015 held in madrid spain in june 2015 the 50 revised full papers presented together with 3 keynotes 79 poster presentations 13 doctoral consortium papers 16 workshop abstracts and 8 interactive event papers were carefully reviewed and selected from numerous submissions the conference provides opportunities for the cross fertilization of approaches techniques and ideas from the many fields that comprise aied including computer science cognitive and learning sciences education game design psychology sociology linguistics as well as many domain specific areas

the area of computer graphics is characterized by rapid evolution new techniques in hardware and software developments e g new rendering methods have led to new applications and broader acceptance of graphics in fields such as scientific visualization multi media applications computer aided design and virtual reality systems the evolving functionality and the growing complexity of graphics algorithms and systems make it more difficult for the application programmer to take full advantage of these systems conventional programming methods are no longer suited to manage the increasing complexity so new programming paradigms and system architectures are required one important step in this direction is the introduction and use of object oriented methods intuition tells us

that visible graphical entities are objects and experience has indeed shown that object oriented software techniques are quite useful for graphics the expressiveness of object oriented languages compared to pure procedural languages gives the graphics application programmer much better support when transforming his mental intentions into computer code moreover object oriented software development is a well founded technology allowing software to be built from reusable and extensible components this book contains selected reviewed and thoroughly revised versions of papers submitted to and presented at the fourth eurographics workshops on object oriented graphics held on may 9 11 1994 in sintra portugal

ongoing advancements in modern technology have led to significant developments in intelligent systems with the numerous applications available it becomes imperative to conduct research and make further progress in this field intelligent systems concepts methodologies tools and applications contains a compendium of the latest academic material on the latest breakthroughs and recent progress in intelligent systems including innovative studies on information retrieval artificial intelligence and software engineering this multi volume book is an ideal source for researchers professionals academics upper level students and practitioners interested in emerging perspectives in the field of intelligent systems

advances in genetic programming reports significant results in improving the power of genetic programming presenting techniques that can be employed immediately in the solution of complex problems in many areas including machine learning and the simulation of autonomous behavior popular languages such as c and c++ are used in many of the applications and experiments illustrating how genetic programming is not restricted to symbolic computing languages such as lisp researchers interested in getting started in genetic programming will find information on how to begin on what public domain code is available and on how to become part of the active genetic programming community via electronic mail
