in the rapidly evolving landscape of technology innovation and sustainability there is a growing need to explore advanced research trends that shape our understanding and implementation of solutions for a sustainable future emerging fields such as renewable energy artificial intelligence ai and circular economy principles are at the forefront of this exploration driving transformative changes across industries understanding these trends allows us to create resilient solutions to promote

economic growth environmental protection and social well being this commitment to innovation and sustainability will be essential for fostering a balanced and prosperous future advanced research trends in sustainable solutions data analytics and security introduces new research trends that could change how we perceive use and integrate technology in a rapidly changing world it advances the understanding of how technology and innovation can contribute to sustainable development fostering interdisciplinary collaborations that transcend traditional boundaries and inspiring actionable initiatives that address global challenges covering topics such as artificial intelligence ai green infrastructure and sustainable tourism this book is an excellent resource for researchers practitioners policymakers academicians and more

environment behavior studies for healthcare design explains how environment behavior eb studies can contribute to healthcare design research and explores how evidence based theories can be applied and integrated into the healthcare design practice drawing on eb theories and the latest research in environment behavior studies this book shows how the healthcare environment can positively impact patients and caregivers well being and healthcare organization s efficiency by modifying environmental attributes such as space configuration color lighting signage acoustics and artwork it addresses a range of healthcare facilities including children s hospitals long term care acute care and outpatient care facilities and uses a range of evidence based design research methods such as interviews focus groups observations surveys and space syntax the author also explains how research evidence and evidence based design can be integrated into healthcare design more cohesively in a redefined design process this book provides a solid conceptual structure that informs a clear map for understanding the eb theories and their applications in healthcare design this research guide for healthcare design helps students academics designers and architects reconsider how to create environments that support patients healing and well being whilst considering efficiency and safety

this book deals with transportation processes denoted as the real time distribution of perishable goods rdopg the book presents three contributions that are made to the field of transportation first a model considering the minimization of customer inconvenience is formulated second a pro active real time control approach is proposed stochastic knowledge is generated from past request information by a new forecasting approach and is used in the pro active approach to guide vehicles to request likely areas before real requests arrive there various computational results are presented to show that in many cases the pro active approach is able to achieve significantly improved results moreover a measure for determining the structural quality of request data sets is also proposed the third contribution of this book is a method that is presented for considering driver inconvenience aspects which arise from vehicle en route diversion activities specifically this method makes it possible to restrict the number of performed vehicle en route diversion activities

this is the second part of a major theoretical work by patrik schumacher which outlines how the discipline of architecture should be understood as its own distinct system of communication autopoeisis comes from the greek and means literally self production it was first adopted in biology in the 1970s to describe the essential characteristics of life as a circular self

organizing system and has since been transposed into a theory of social systems this new approach offers architecture an arsenal of general comparative concepts it allows architecture to be understood as a distinct discipline which can be analyzed in elaborate detail while at the same time offering insightful comparisons with other subject areas such as art science and political discourse on the basis of such comparisons the book insists on the necessity of disciplinary autonomy and argues for a sharp demarcation of design from both art and engineering schumacher accordingly argues controversially that design as a discipline has its own sui generis intelligence with its own internal logic reach and limitations whereas the first volume provides the theoretical groundwork for schumacher's ideas focusing on architecture as an autopoietic system with its own theory history medium and its unique societal function the second volume addresses the specific contemporary challenges and tasks that architecture faces it formulates these tasks looking specifically at how architecture is seeking to organize and articulate the complexity of post fordist network society the volume explicitly addresses how current architecture can upgrade its design methodology in the face of an increasingly demanding task environment characterized by both complexity and novelty architecture's specific role within contemporary society is explained and its relationship to politics is clarified finally the new global style of parametricism is introduced and theoretically grounded

this contributed volume presents a collection of materials on supply chain management including industry based case studies addressing petrochemical pharmaceutical manufacturing and reverse logistics topics moreover the book covers sustainability issues as well as optimization approaches the target audience comprises academics industry managers and practitioners in the field of supply chain management being the book also beneficial for graduate students

efficiency in public and freight transportation systems is of great importance for a society railways can offer high capacity and relatively low environmental impact but require that several technical systems are tuned and operate well specifically there is a tight interdependency between infrastructure and trains the consequences are that all subsystems must be maintained and that the coordination of infrastructure activities and train operations is essential railway infrastructure maintenance and train services should ideally be planned together but practice and research about railway scheduling has historically focused mainly on train operations and timetabling while maintenance planning has received less attention and little research has considered the joint scheduling of both types of activities instead the traditional approach has been a sequential and iterative planning procedure where train timetabling often has precedence over infrastructure maintenance this thesis studies how maintenance windows which are regular time windows reserved for maintenance work can be dimensioned and jointly scheduled with train services in a balanced and efficient way for both maintenance contractors and train operators mathematical methods are used with the aim of advancing the knowledge about quantitative methods for solving such coordination problems the thesis contributes with new optimization models that jointly schedule maintenance windows and train services investigates the solving efficiency of these models and studies crucial extensions of the planning problem primarily for the consideration of maintenance resources furthermore the models are applied to verified and validated on a demanding real life problem instance the main results are that integrated and optimal scheduling of

maintenance windows and train services is viable for problems of practical size and importance and that substantial maintenance cost savings can be achieved with such an integrated approach as compared to a traditional sequential planning process the thesis consists of an introduction and overview of the research followed by six papers which present 1 a cost benefit model for assessment of competing capacity requests at a single location 2 an optimization model for integrated scheduling of both maintenance windows and train services 3 mathematical reformulations that strengthen the optimization model 4 extensions for handling resource considerations and cyclic schedules 5 a case study for a major single track line in sweden and 6 a mathematical study of length restricted sequences under cyclic conditions

architecture has attracted increasing worldwide attention in recent years not only because of its cultural significance but also because of concern over the performance and resource implications of buildings 101 in depth articles by international scholars and practitioners bring the subject into focus by examining issues from various viewpoints please contact your representative for a leaflet detailing full contents and contributors it also includes sample pages and several illustrations from the book

for courses in management science quantitative methods or decision models this widely adopted text presents an accessible introduction to the techniques and applications of management science it is designed to make the subject easy to understand interesting and accessible for students with limited mathematical background or skills the author focuses on management science not only as a collection of techniques and processes but as a philosophy and method for approaching problems in a logical manner and includes spreadsheets with solutions in every chapter
