this book provides a gentle introduction to the foundations of algebraic geometry starting from computational topics ideals and homogeneous ideals zero loci of ideals up to increasingly intrinsic and abstract arguments such as algebraic varieties whose natural continuation is a more advanced course on the theory of schemes vector bundles and sheaf cohomology valuable to students studying algebraic geometry and geometry this title contains around 60 exercises with solutions to help students thoroughly understand the theories introduced in the book proofs of the results are carried out in full detail many examples are discussed in order to reinforce the understanding of both the theoretical elements and their consequences as well as the possible applications of the material

this book is designed as a text for a first course on functional analysis for advanced undergraduates or for beginning graduate students it can be used in the undergraduate curriculum for an honors seminar or for a capstone course it can also be used for self study or independent study the course prerequisites are few but a certain degree of mathematical sophistication

is required a reader must have had the equivalent of a first real analysis course as might be taught using 25 or 109 and a first linear algebra course knowledge of the lebesgue integral is not a prerequisite throughout the book we use elementary facts about the complex numbers these are gathered in appendix a in one specific place section 5.3 we require a few properties of analytic functions these are usually taught in the first half of an undergraduate complex analysis course because we want this book to be accessible to students who have not taken a course on complex function theory a complete description of the needed results is given however we do not prove these results

this is the second of three volumes of a corpus publication of the greek bilingual and trilingual inscriptions from ptolemaic egypt covering the period from alexander's conquest in 332 bc to the fall of alexandria to the romans in 30 bc this volume contains 221 numbered items some covering multiple short texts from the fayum and middle and upper egypt including the thebaid it presents up to date scholarly revisions of the texts with translations full descriptions and commentaries drawing on material originally collected by the late p. m. fraser the inscriptions from the fayum illustrate the development of towns and villages in a region which was particularly reshaped by greek immigrants while the texts from upper egypt and the thebaid reflect the persistence of indigenous egyptian traditions and their interaction with the impact of greek culture the inscriptions range from copies of major priestly and royal decrees civic administrative documents and asylum petitions involving egyptian and greek temples and cults to dedications to gods monarchs and private individuals funerary texts pilgrimage notices and verse inscriptions including re-editions and reassessments of the isis hymns from narmouthis and the herodes funerary epigrams from edfu together with their hieroglyphic counterparts the corpus supersedes older publications and other partial collections organised by specific region or theme and offers for the first time a full picture of the greek and multilingual epigraphic landscape of the ptolemaic period it will be an indispensable resource for new and continuing research into the history society and culture of ptolemaic egypt and the wider hellenistic world

in this broad introduction to topology the author searches for topological invariants of spaces together with techniques for calculating them students with knowledge of real analysis elementary group theory and linear algebra will quickly become familiar with a wide variety of techniques and applications involving point set geometric and algebraic topology over 139 illustrations and more than 350 problems of various difficulties will help students gain a rounded understanding of the subject

this text is designed for a one semester course in optimization taken by advanced undergraduate and beginning graduate students in the mathematical sciences and engineering it teaches students the basics of continuous optimization and helps them better understand the mathematics from previous courses the book focuses on general problems and th

the primary goal of these lectures is to introduce a beginner to the finite dimensional representations of lie groups and lie algebras since this goal is shared by quite a few other books we should explain in this preface how our approach differs although the potential reader can probably see this better by a quick browse through the book representation theory is simple to define it is the study of the ways in which a given group may act on vector spaces it is almost certainly unique however among such clearly delineated subjects in the breadth of its interest to mathematicians this is not surprising group actions are ubiquitous in 20th century mathematics and where the object on which a group acts is not a vector space we have learned to replace it by one that is e.g. a cohomology group tangent space etc as a consequence many mathematicians other than specialists in the field or even those who think they might want to be come in contact with the subject in various ways it is for such people that this text is designed to put it another way we intend this as a book for beginners to learn from and not as a reference this idea essentially determines the choice of material covered here as simple as is the definition of representation theory given above it fragments considerably when we try to get more specific
