billions of dollars are tied up in the inventories of manufacturing companies which cause large interest costs a small decrease of the inventory and or production costs without reduction of the service level can increase the profit substantially especially in the case of scarce capacity efficient production schedules are fundamental for short delivery time and on time delivery which are important competitive priorities to support decision makers by improving their manufacturing resource planning system with appropriate methods is one of the most of production planning interesting challenges the following chapters contain new models and new solution strategies which may be helpful for decision makers and for further research in the areas of production planning and operations research the main subject is on lotsizing and scheduling the objectives and further characteristics of such problems can be inferred from practical need thus before an outline is given we consider the general objectives of lotsizing and scheduling and classify the most important characteristics of such problems in the following sections

astronomy like any experimental subject needs statistical methods to interpret data reliably this

practical handbook presents the most relevant statistical and probabilistic machinery for use in observational astronomy classical parametric and non parametric methods are covered but there is a strong emphasis on bayesian solutions and the importance of probability in experimental inference chapters cover basic probability correlation analysis hypothesis testing bayesian modelling time series analysis luminosity functions and clustering the book avoids the technical language of statistics in favour of demonstrating astronomical relevance and applicability it contains many worked examples and problems that make use of databases which are available on the it is suitable for self study at advanced undergraduate or graduate level as a reference for professional astronomers and as a textbook basis for courses in statistical methods in astronomy

integrates the theory and applications of statistics using r a course in statistics with r has been written to bridge the gap between theory and applications and explain how mathematical expressions are converted into r programs the book has been primarily designed as a useful companion for a masters student during each semester of the course but will also help applied statisticians in revisiting the underpinnings of the subject with this dual goal in mind the book begins with r basics and quickly covers visualization and exploratory analysis probability and statistical inference inclusive of classical nonparametric and bayesian schools is developed with definitions motivations mathematical expression and r programs in a way which will help the reader to understand the mathematical development as well as r implementation linear regression models experimental designs multivariate analysis and categorical data analysis are treated in a way which makes effective use of visualization techniques and the related statistical techniques underlying them through practical applications and hence helps the reader to achieve a clear understanding of the associated statistical models key features integrates r basics with statistical concepts provides graphical presentations inclusive of mathematical expressions aids understanding of limit theorems of probability with and without the simulation approach presents detailed algorithmic development of statistical models from scratch includes practical applications with over 50 data sets
