this book brings together some of the best practitioners and thinkers from around the world to discuss the likely future of information and communication technologies for the construction industry. It addresses a range of innovative developments, state of the art applications, research work and theoretical arguments with regard to the use of virtual technologies in design, construction and procurement from a future oriented perspective. The book presents what can be expected from the next generation of these technologies.

The papers presented at Building Information Modelling 2017 BIM are from a range of forums including plenary papers, workshops, seminars and panel sessions. The conference was attended by experts from industry practice and academia sharing their work on key topics: the development of innovative solutions and the identification of future trends. The volume gives details of how BIM tools and techniques have fundamentally altered the manner in which modern construction teams operate, the processes through which designs are evolved and the relationships between conceptual detail, construction and life cycle stages. BIM is essentially value creating collaboration throughout the entire life cycle of an asset, underpinned by the statistics attached to them and has far reaching consequences on both building procurement and infrastructure. BIM 2017 papers cover topics such as BIM in design, coordination, construction, operations, building operation and maintenance, BIM and sustainability, collaborative working and practices, facilities management, integration and GIS integration, automation in construction, health and safety, BIM and interoperability, life cycle project management, cultural heritage, BIM and robotics, risk analysis and management and emergency analysis, planning and management.

Addressing the interactions between the different design and construction variables and techniques, this book illustrates best practices for constructing economical long life concrete pavements. The book proceeds in much the same way as a pavement construction project: first different alternatives for concrete pavement solutions are outlined, the desired performance and behaviour parameters are identified, next appropriate materials are outlined and the most suitable concrete proportions determined. The design can be completed and then the necessary construction steps for translating the design into a durable facility are carried out. Although the focus reflects highways as the most common application, special features of airport, industrial and light duty pavements are also addressed. Use is made of modeling and performance tools such as HIPERPAV and ITPP to illustrate behavior and performance along with some case studies. As concrete pavements are more complex than they seem and the costs of mistakes or of over design can be high, this is a valuable book for engineers in both the public and private sectors.

The major expansion of transport networks in the twentieth century has been accompanied by extensive bridge construction. At the end of the century, the field of bridge engineering continues to grow and develop. Recent years have seen the construction of revolutionary new bridges, advances in materials and construction techniques and the development of international codes and standards aimed at producing more durable and reliable structures.
