this book covers both fundamental and practical aspects of chemical analysis data process and analysis chemical equilibria and volumetric titrations gravimetry spectrophotometry sample preparation and separation methods in quantitative analysis it was written with the rich tradition of teaching at peking university college of chemistry and edited by an american professor who was personally sensitive to the needs of students learning science from traditional chemistry textbooks written in english many examples and illustrative problems in this text have been taken from previous textbooks by the peking

university team teaching program the book can be used as a starter in analytical chemistry which is fundamental and the base upon which chemistry is built traditional chapters of initial learning in analytical chemistry are included such as volumetric gravimetric and separation methods the book also includes key chapters on problem solving relating to recent progress in analytical chemistry

an approach to chemical analysis its development and practice provides an overview of the development of chemical analysis and its application in solving analytical problems in chemistry the text is comprised of 19 chapters that are organized into two parts in the first part the text covers the historical aspects of chemical the book then proceeds to tackling methods for analysis in which the final measurement is preceded by one or more chemical reactions the first two chapters of the second part discuss distillation and chromatography respectively next the title details the physical methods that only occasionally and incidentally need to be preceded by chemical reactions the text will be of great use for students researchers and practitioners of chemistry

often considered as a simple task chemical analysis actually requires a variety of quite complex skills as a practitioner in an interdisciplinary science the analytical scientist is relied upon to have the knowledge and skill to help solve problems or to provide relevant information they will need to think laterally examine the process from sampling to final result carefully in addition to selecting the appropriate technique in order to satisfy the objective and obtain a reliable result the aim of this book is to provide basic training in the whole analytical process for students demonstrating why analysis is necessary and how to take samples before they attempt to carry out any analysis in the laboratory initially planning of work and collection and preparation of the sample are discussed in detail this is followed by a look at issues of quality control and accreditation and the basic equipment eg balances glassware and techniques that are required throughout safety issues are addressed and examples and practical exercises are given chemical analysis in the laboratory a basic guide will prove invaluable for students of chemistry plant science food science biology agriculture and soil science providing them with a guide to the skills that will be required in the analytical laboratory teachers and lecturers will also find the material of assistance in developing the analytical thinking and skills of their students new employees in analytical laboratories will welcome it as an indispensable guide
