this book completes a trilogy numbers 5 7 and 8 of the series the classification of the finite simple groups treating the generic case of the classification of the finite simple groups in conjunction with numbers 4 and 6 it allows us to reach a major milestone in our series the completion of the proof of the following theorem theorem o let g be a finite simple group of odd type all of whose proper simple sections are known simple groups then either g is an alternating group or g is a finite group of lie type defined over a field of odd order or g is one of six sporadic simple groups put another way theorem o asserts that any minimal counterexample to the classification of the finite simple groups must be of even type the work of aschbacher and smith shows that a minimal counterexample is not of quasithin even type while this volume shows that a minimal counterexample cannot be of generic even type modulo the treatment of certain intermediate configurations of even type which will be ruled out in the next volume of our series

this book provides an introduction to representations of both finite and compact groups the proofs of the basic results are given for the finite case but are so phrased as to hold without change for compact topological groups with an invariant integral replacing the sum over the group elements as an averaging tool among the topics covered are the relation between representations and characters the construction of irreducible representations induced representations and frobenius reciprocity special emphasis is given to exterior powers with the symmetric group sn as an illustrative example the book concludes with a chapter comparing the representations of the finite group sl2 p and the non compact lie group sl2 p

actions and invariants of algebraic groups second edition presents a self contained introduction to geometric invariant theory starting from the basic theory of affine algebraic groups and proceeding towards more sophisticated dimensions building on the first edition this book provides an introduction to the theory by equipping the reader with the tools needed to read advanced research in the field beginning with commutative algebra algebraic geometry and the theory of lie algebras the book develops the necessary background of affine algebraic groups over an algebraically closed field and then moves toward the algebraic and geometric aspects of modern invariant theory and quotients

this volume a celebration of anthony joseph s fundamental influence on classical and quantized representation theory explores a wide array of current topics in lie theory by experts in the area the chapters are based on the 2017 sister conferences titled algebraic modes of representations the first of which was held from july 16 18 at the weizmann institute of science and the second from july 19 23 at the university of haifa the chapters in this volume cover a range of topics including primitive ideals invariant theory geometry of lie group actions quantum affine algebras yangians categorification vertex algebras this volume is addressed to mathematicians who specialize in representation theory and lie theory and who wish to learn more about this fascinating subject

through the 1990s a circle of ideas emerged relating three very different kinds of objects associated to a complex semisimple lie algebra nilpotent orbits representations of a weyl group and primitive ideals in an enveloping algebra the principal aim of this book is to collect together the important results concerning the classification and properties of nilpotent orbits beginning

from the common ground of basic structure theory the techniques used are elementary and in the toolkit of any graduate student interested in the harmonic analysis of representation theory of lie groups the book develops the dynkin konstant and bala carter classifications of complex nilpotent orbits derives the lusztig spaltenstein theory of induction of nilpotent orbits discusses basic topological questions and classifies real nilpotent orbits the classical algebras are emphasized throughout here the theory can be simplified by using the combinatorics of partitions and tableaux the authors conclude with a survey of advanced topics related to the above circle of ideas this book is the product of a two quarter course taught at the university of washington
