in many decision problems e g from the area of production and logistics management the evaluation of alternatives and the determination of an optimal or at least suboptimal solution is an important but difficult task for most such problems no efficient algorithm is known and classical approaches of operations research like mixed integer linear programming or dynamic programming are often of limited use due to excessive computation time therefore dedicated heuristic solution approaches have been developed which aim at providing good solutions in reasonable time for a given problem however such methods have two major drawbacks first they are tailored to a specific problem and their adaption to other problems is difficult and

in many cases even impossible second they are typically designed to build one single solution in the most effective way whereas most decision problems have a vast number of feasible solutions hence usually the chances are high that there exist better ones to overcome these limitations problem independent search strategies in particular metaheuristics have been proposed this book provides an elementary step by step introduction to metaheuristics focusing on the search concepts they are based on the first part demonstrates underlying concepts of search strategies using a simple example optimization problem
