this thesis explores thermal transport in selected rare earth based intermetallic compounds to answer questions of great current interest it also sheds light on the interplay of kondo physics and fermi surface changes by performing thermal conductivity and electrical resistivity measurements at temperatures as low as 25mk the author demonstrates that the wiedemann franz law a cornerstone of metal physics is violated at precisely the magnetic field induced quantum critical point

of the heavy fermion metal  $\text{YbRh}_2\text{Si}_2$  this first ever observation of a violation has dramatic consequences as it implies a breakdown of the quasiparticle picture utilizing an innovative technique to measure low temperature thermal transport isothermally as a function of the magnetic field the thesis interprets specific partly newly discovered high field transitions in  $\text{CeRu}_2\text{Si}_2$  and  $\text{YbRh}_2\text{Si}_2$  as Lifshitz transitions related to a change in the Fermi surface lastly by applying this new technique to thermal conductivity measurements of the skutterudite superconductor  $\text{LaPt}_4\text{Ge}_{12}$  the thesis proves that the system is a conventional superconductor with a single energy gap thus it refutes the widespread speculations about unconventional Cooper pairing in this material

This solutions manual to elements of quantum mechanics features complete solutions prepared by the author to all of the exercises in the text the manual contains detailed worked through solutions to all problems with written explanations of the steps concepts and physical meaning of the problems the manual is available free to instructors upon adoption of the text
