a detailed flora with full keys and descriptions of plants occurring in the wild in the british isles

since its first publication in 1991 new flora of the british isles has become established as the standard work on the identification of the wild vascular plants of the british isles the flora remains unique in many features including its full coverage of all british wild plants its user friendly organisation and its specially compiled keys and descriptions this new edition includes the addition of more than 160 species so that 4 800 taxa are now covered in varying degrees of detail it also incorporates the new molecular system of classification based on dna sequences furthermore it includes 1600 species illustrations rewritten distributions and an overhaul of the designation of degrees of rarity with the introduction of a third less rare category these revisions should ensure that this third edition remains the essential reference source for all taxonomists ecologists conservationists plant hunters and biogeographers whether they be researchers teachers students or amateurs

vascular plant hybrids are numerous and constitute an important feature of our vegetation but all too often they have been neglected by botanists some hybrids between native species are rare sterile and ephemeral but others reproduce vegetatively or by seed and have spread beyond the areas where their parents coexist in addition numerous hybrids have escaped from gardens to become established in the wild interspecific hybridisation is particularly significant as it represents a major evolutionary pathway in flowering plants frequently it alters the characteristics of both native and alien taxa and it generates new species the hybrid flora of the british isles has been studied in more detail than that of any other region and it therefore provides an ideal opportunity to study the occurrence of hybrids in wild vegetation this book provides detailed accounts of the 909 hybrids reliably recorded in the wild in the british isles of particular interest to bsbi members are the comprehensive identification notes including a summary of the differences from the parents enabling naming and recording of hybrids to a degree not attainable previously the habitats of the hybrids are outlined and detailed accounts of their distributions provided with notes on the discovery of many hybrids there are 388 novel maps illustrating the records of the commoner hybrids in relation to those of their parents known chromosome numbers are given for each hybrid and its parents and information is provided on the hybrid s fertility sterility and its capacity for vegetative reproduction

experimental and molecular studies of the hybrids in the british isles and elsewhere in their ranges are summarised briefer notes are given on a further 156 hybrids including some which are erroneously or doubtfully recorded and others which might potentially occur as escapes from cultivation

since its first publication in 1991 new flora of the british isles has become established as the standard work on the identification of the wild flowering plants ferns and conifers of the british isles the flora remains unique in many features including its full coverage of all our wild plants in one volume it s user friendly organisation and its specially compiled keys and descriptions all native naturalised crop and repeatedly occurring casual plants are included more than 200 species and hybrids have been added to the text of this fourth edition and in order to establish it as a truly twenty first century flora alien species that have not been recorded in the british isles since 1999 about 90 taxa are omitted from the main text the third edition 2010 was the first british flora to incorporate the new molecular system of classification based primarily on dna sequences a scheme that is expected to endure for centuries to come at the family level however new discoveries from this research are continually being made necessitating numerous further changes particularly at the genus level which have been incorporated in this fourth edition back cover

this book describes and illustrates in detail the 760 species of mosses currently known to occur in the british isles and incorporates the most up to date information available on classification and nomenclature together with recent synonyms the species descriptions provide information on frequency ecology geographical relationships and distribution including information on protected species and those species at risk for many species there are footnotes to aid identification in addition to the species descriptions there are descriptions of families and genera and also introductory information on conservation collection preservation and examination of material together with advice on using the keys an artificial key to genera provides the only workable comprehensive key published in the english language this second edition incorporates the very considerable advances in our knowledge of mosses made in the last quarter of the twentieth century and will provide a unique resource for all concerned with these fascinating organisms

who first described our native plants this book attempts to answer that question starting from almost the dawn of printing with william turner s libellus of 1538 of course there were medieval herbals in the five centuries or more before turner and also there is a

vast body of folk lore but turner was the first to describe more than a handful and to do so in print thus printed sources are the cornerstone of this work and the first date is given for each of the 1670 species or aggregates of all the indisputably natives and archaeophytes including 40 or so species that some have argued as native in the last half century but this is supplemented by information from manuscripts and herbaria which enable the display of an earlier date a date of first evidence for just under half of that total the names of the discoverers and the counties where each was first recorded are also given where known though the primary purpose of the book is to show the details of the discovery and recording of each species it will also show the progress of discovery leading to somewhat surprising conclusion that most 85 of our flora had been described by the 1720s once the critical non lowland and doubtful natives have been omitted indeed the main achievement of these last three centuries has been a consolidation of our knowledge the very extensive appendices cover the key herbals and floras the relevant journals the important works on the history of botany some of the national herbaria and have a major section of the botanists who actually discovered the plants back cover

contains the bulk of the print atlas 810 p of species distribution maps and text plus data for 942 additional uncommon species also allows production of lists of species within a particular area comparison of the distribution of 2 species distribution with environmental variables and printing or copying of maps

the native british flora is today relatively ant species on the continent such as picea impoverished today the british isles has a abies norway spruce did not get into britain flora of only about 1500 species of native in time however we must not over flowering plants france and spain each emphasize the importance of britain being an geographically only about twice the area island a comparison of floras on either side have 3 4 times as many species each the of the english channel shows that there are comparison is more marked when consider species present in england and not in ing the endemic species those specialities of northern france as well as vice versa many each geographical region which grow of the species present in northern france but nowhere else if only normal sexual species absent from england are weeds adapted to are considered then there are only about 13 french agriculture others may be limited endemic species in the british isles while 1000 not by the sea but by the climate species are endemic to spain nevertheless the example of ireland however the poverty of the british flora is which was isolated much earlier than the rest not a unique phenomenon the whole of of the british isles does show the effect of north western europe an area including isolation because it

does have a much poorer northern france and much of germany and flora and fauna
