the book is devoted to the theory of algebraic geometric codes a subject formed on the border of
several domains of mathematics on one side there are such classical areas as algebraic geometry
and number theory on the other information transmission theory combinatorics finite geometries
dense packings etc the authors give a unique perspective on the subject whereas most books on
coding theory build up coding theory from within starting from elementary concepts and almost
always finishing without reaching a certain depth this book constantly looks for interpretations that
connect coding theory to algebraic geometry and number theory there are no prerequisites other
than a standard algebra graduate course the first two chapters of the book can serve as an
introduction to coding theory and algebraic geometry respectively special attention is given to the
geometry of curves over finite fields in the third chapter finally in the last chapter the authors
explain relations between all of these the theory of algebraic geometric codes

provides formulas tips strategies and examples for taking the sat mathematics tests and includes

actions and invariants of algebraic groups second edition presents a self contained introduction to
geometric invariant theory starting from the basic theory of affine algebraic groups and proceeding
towards more sophisticated dimensions building on the first edition this book provides an
introduction to the theory by equipping the reader with the tools needed to read advanced research

in the field beginning with commutative algebra algebraic geometry and the theory of lie algebras the book develops the necessary background of affine algebraic groups over an algebraically closed field and then moves toward the algebraic and geometric aspects of modern invariant theory and quotients

this book constitutes the proceedings of the 7th international conference on mathematical software icms 2020 held in braunschweig germany in july 2020 the 48 papers included in this volume were carefully reviewed and selected from 58 submissions the program of the 2020 meeting consisted of 20 topical sessions each of which providing an overview of the challenges achievements and progress in a environment of mathematical software research development and use

this book is concerned with recent advances in fitness landscapes the concept of fitness landscapes originates from theoretical biology and refers to a framework for analysing and visualizing the relationships between genotypes phenotypes and fitness these relationships lay at the centre of attempts to mathematically describe evolutionary processes and evolutionary dynamics the book addresses recent advances in the understanding of fitness landscapes in evolutionary biology and evolutionary computation in the volume experts in the field of fitness landscapes present these findings in an integrated way to make it accessible to a number of audiences senior undergraduate and graduate students in computer science theoretical biology physics applied mathematics and engineering but also researcher looking for a reference or and entry point into using fitness landscapes for analysing algorithms also practitioners wanting to employ fitness landscape techniques for evaluating bio and nature inspired computing algorithms can find valuable material in the book for teaching proposes the book could also be used as a reference handbook
