bachelor thesis from the year 2015 in the subject business economics offline marketing and online marketing grade 2 3 university of applied sciences essen language english abstract the increasing requirements for the effectivity of a website and the more and more complex knowledge about human behavioral patterns are challenging the online presence of banks nowadays a good usability by itself is no significant basis for decision making and the choice of a house bank good usability is expected rather the user experience is an essential factor for the success of a website due to the fact that the human behavior is determined by unconscious patterns it is necessary to take these into consideration when conceptualizing a website in order to develop a user centered target oriented website design by means of persuasive design it is possible to directly address these behavioral patterns therefore it is reasonable to optimize the user experience by the application of persuasive design methods this shall provide a motivating experience in consideration of decision making tools and motives of the user in this way it is possible to generate competitive advantage and to gain new customers as well as to boost customer loyalty here the need for emotionalizing plays a particularly important role but especially in view of banking products it is difficult to create an emotional presentation due to the absence of haptics and because accounts are rather a functional instrument and a means to an end than a product with a high pleasure value cooperative banks however benefit particularly from this competitive advantage due to the cooperative idea and their values and principles they are enabled to address potential customers emotionally if values are illustrated the users have the opportunity to identify themselves with those and to align them with their own ideals

this book deals with an information driven approach to plan materials discovery and design iterative learning the authors present contrasting but complementary approaches such as those based on high throughput calculations combinatorial experiments or data driven discovery together with machine learning methods similarly statistical methods successfully applied in other fields such as biosciences are presented the content spans from materials science to information science to reflect the cross disciplinary nature of the field a perspective is presented that offers a paradigm codesign loop for materials design to involve iteratively learning from experiments and calculations to develop materials with optimum properties such a loop requires the elements of incorporating domain materials knowledge a database of descriptors the genes a surrogate or statistical model developed to predict a given property with uncertainties performing adaptive experimental design to guide the next experiment or calculation and aspects of high throughput calculations as well as experiments the book is about manufacturing with the aim to halving the time to discover and design new materials accelerating discovery relies on using large databases computation and mathematics in the material sciences in a manner similar to the way used to in the human genome initiative novel approaches are therefore called to explore the enormous phase space presented by complex materials and processes to achieve the desired performance gains a predictive capability is needed to guide experiments and computations in the most fruitful directions by reducing not successful trials despite advances in computation and experimental techniques generating vast arrays of data without a clear way of linkage to models the full value of data driven discovery cannot be realized hence along with experimental theoretical and computational materials science we need to add a fourth leg to our toolkit to make the materials genome a reality the science of materials informatics

a genetic algorithm ga has been used in conjunction with the numerical electromagnetics code version 2 nec2 to create and optimize atypical wire antenna designs with impressive characteristics antenna design parameters are encoded into an ordered series of numbers and or symbols analogous to a biological chromosome a cost function that quantifies how well a design meets the engineer s specifications is created the ga uses these to generate and evaluate a population of designs the most successful designs are then promoted and mixed through mating and mutation while poor designs are removed this process difficult to trap in local minima continues until convergence criteria are met generally yielding excellent designs with no user intervention or initial guesses three antennas have been optimized a monopole loaded with a modified folded dipole the yagi antenna and the crooked wire genetic antenna prior study of the loaded monopole had shown hemispherical coverage was possible the ga found an asymmetric loaded monopole with an average variation in gain over the hemisphere of only 0 4db confirmed by measurement ga optimized yagi antennas surpassed the gain of conventional yagis by about 1db improvement also confirmed by measurement the ga designed a yagi with a beamwidth of 50 deg 60 deg sidelobes nearly 25db down and a 14 bandwidth specifications difficult to achieve using conventional techniques the crooked wire genetic antenna is several wires joined in series locations and lengths are determined by the ga optimization for hemispherical coverage with right hand circular polarization rhcp produced highly unusual shapes unrealizable using a conventional approach rhcp hemispherical coverage was achieved with less than 4db variation measurements verify the results
